

TrustDoc Sample Engineering SOP

Deployment Checklist

Before deploying code, engineers must open a pull request, pass automated tests, receive at least one peer review, and confirm that environment variables are not exposed.

Production deployments should include a rollback plan, deployment owner, monitoring link, and a brief release note. High-risk deployments require manager approval.

After deployment, engineers should monitor application logs, error rates, and latency for at least 30 minutes.

Incident Response

For severity one incidents, the on-call engineer must acknowledge the alert, create an incident channel, notify the engineering lead, and post status updates every 15 minutes.

A post-incident review should identify root cause, customer impact, timeline, owner, and follow-up actions.
